Source: Mysteel

- Nickel prices traded steadily last week, with the most-traded SHFE nickel contract closing the day session at Yuan 133,010/tonne on Friday (April 10). The news of 210 million tonnes of approved RKAB nickel ore quotas in Indonesia did not significantly influence the market sentiment. Late last week, Indonesia signaled a potential revision to the HPM formula, but market participants remained cautious as the specific formula was yet to be disclosed.
- For nickel ore, Indonesia indicated that approved RKAB quotas stood at around 210 million tonnes, with the overall nickel ore supply remaining tight. In the spot market, premiums for some nickel ore have risen to around \$45/wmt, while downstream buyers, facing losses, continued to push back on ore prices. Additionally, Indonesia planned to revise the HPM formula, which was expected to add pricing components for cobalt, chromium, and iron in nickel ore. Market participants are advised to monitor the specific tax implications.
- On the refined nickel front, market trading activity remained subdued last week. The overall supply was ample, and premiums/discounts for some brands saw notable declines. Market offers for raw materials like MHP rose amid expectations of a tight sulfur supply, keeping nickel costs strong.
- Last week, the nickel sulfate market remained stable but under pressure. Downstream ternary precursor manufacturers had poor demand expectations for April and significantly slowed the purchases, thus the buyers aggressively pushed prices down. Meanwhile, upstream raw materials offered some support due to slow RKAB approvals in Indonesia and the tight supply of nickel intermediates.

- The most-traded GFEX (Guangzhou Futures Exchange) lithium carbonate contract remained on the downward trajectory in the week ending April 10, with the settlement price edging down 2.42% as of Friday April 10 against the previous Friday, data showed.
- On the news front, it is reported around April 8 that Zimbabwe's Ministry of Mines has informed producers that it will introduce export quotas for lithium concentrate. As a condition for resuming mineral exports, companies will be required to commit to increasing local processing. Meanwhile, until the full ban on lithium concentrate exports takes effect in January 2027, a 10% export duty on lithium concentrate will remain in place.
- Elsewhere, according to data from China Automobile Dealers Association, in March, retail sales of electric passenger vehicles reached 848,000 units, down 14.4% year-on-year but up 82.6% month-on-month. For the first quarter of 2026, cumulative retail sales totaled 1.908 million units, a year-on-year decline of 21.1%. The downturn reflects the combined impact of the subsidy adjustment and the post-Chinese New Year market recovery.
- In March, electric passenger vehicle exports by manufacturers reached 349,000 units, up 139.9% year-on-year and 29.6% month-on-month. For the first quarter, cumulative exports stood at 908,000 units, a year-on-year increase of 123.7%.
- On the spot market, though the market players speculated on continued supply disruptions, the demand end failed to follow suit, even though the lithium prices turned soft. Mysteel's tracking suggested that the weekly spot transaction volume of lithium carbonate has been contracting since the middle of March, and the carbonate inventory across the industry chain has stopped destocking for several weeks in a row, though the inventory did now show palpable accumulation.
- To sum up, the players are now in a tug-of-war centering the timeline of Zimbabwe relaxing the export ban as well as the electric vehicles performance in April, on the expectations of lithium carbonate supply-demand balance remaining tight in April based on Mysteel's survey of production scheduling.

Product	Weekly Comment
Nickel Ore	Last week, premiums for Indonesia’s laterite nickel ore remained strong, while the medium and high-grade nickel ore prices in the Philippines showed mild drops. In Indonesia, RKAB quotas have been approved with a combined volume of 210 million tonnes, though some mines and traders were yet to receive their quota approvals. The nickel ore premiums for domestic trade in Indonesia remained strong. Additionally, the rainfall in Sulawesi, Indonesia has increased. It is expected that the rainfall in April will continue to intensify, and the supply tightness is unlikely to ease in the short term. In the Philippines, traders’ nickel ore quotations continued to reduce. CIF offers for 1.3% nickel ore stood at US \$47-49/wmt, while CIF offers for 1.4% ore were at US \$68/wmt. Sea freight continued to fall, further reducing landed costs. However, Chinese NPI smelters showed low acceptance of high-priced ore, and CIF prices of nickel ore from the Philippines are expected to edge lower.

Product	Weekly Comment
Refined Nickel	Last week, the spot refined nickel prices trended lower, with the trading activity subdued overall. Downstream buyers showed low willingness to build inventories and purchased only as needed for production, leaving traders under considerable selling pressure. The spot supply of Jinchuan nickel was ample, and its premiums weakened during the week. Brands such as Nikkelverk and Sumitomo also faced pressure, with their premiums following suit and dropping. As the SHFE nickel contract delivery date approached, the premiums/discounts for electrowinning nickel brands such as Huayou rebounded somewhat. Amid poor trading, some traders had shifted their positions back to the 2604 contract in preparation for delivery. Currently, China’s refined nickel production has remained active, the traders’ inventories continue to accumulate, and spot supply remains generally ample.
Nickel Sulfate	China’s nickel sulfate market remained stable but was under pressure last week. The actual market performance was lackluster, as downstream ternary precursor manufacturers held poor demand expectations for April, significantly reducing their purchases of nickel sulfate. In this case, the buyers took a strong stance on pushing prices down. Nevertheless, the raw materials provided some support, as RKAB approvals in Indonesia progressed slowly and the supply of nickel intermediates remained tight. Overall, caught between weak demand and cost support, nickel sulfate prices are likely to remain in a weak and range-bound pattern in the near term.

Weekly Newsfeeds

Product	Weekly Comment
Cobalt Intermediate	The cobalt intermediates prices remained flat last week, with quotations stalling at US \$25.9 per pound and no actual transactions reported. From February to March, downstream demand decreased significantly, while transaction prices for cobalt salts and Co3O4 declined, leading to lower profit margins for smelters, which suppressed the upward movement of cobalt intermediate prices. The arrivals of cobalt intermediates in April are expected to be less than 2,000 tonnes in metal content, most of which are committed under long-term agreements, resulting in low spot market liquidity. Meanwhile, it remains difficult for cargoes under long-term contracts to achieve price increases.
Cobalt Sulfate & Chloride	The trading activity in the cobalt sulfate and cobalt chloride market remained lackluster last week, although some ternary cathode material plants made a few inquiries. The high operating costs provided support for cobalt sulfate prices, with quotations maintained in the range of Yuan 94,000-96,000/tonne. The cobalt sulfate market continued to be challenged by poor actual demand. Looking ahead to April, cobalt sulfate producers have low confidence in both production and shipments. In addition, affected by persistently high sulfuric acid prices, cobalt sulfate producers saw their profit margins narrow. Coupled with poor sales, some producers are considering adjusting their production structures. Due to persistently weak downstream demand for Co3O4, cobalt chloride quotations weakened and showed signs of further declines, though prices remained temporarily stable supported by costs. Some downstream manufacturers with flexible production lines are considering purchasing low-priced cobalt sulfate as a raw material supplement, further contributing to a cooler trading atmosphere in the cobalt chloride market.

Product	Weekly Comment
Electrolytic Cobalt	China's electrolytic cobalt market extended its weakness last week, with the market prices moving further downward. Spot prices experienced persistent declines, weighed down by capital flows and macro sentiment. Following the decline, traders became more inclined to hold prices firm, and basis rebounded. The lower spot prices led to a slight improvement in downstream purchasing, though overall demand remained limited to cautious just-in-time inventory replenishment, with transaction activity remaining subdued. On the supply side, the Democratic Republic of the Congo's (DRC) new quota policy requires miners to complete the write-off of unfulfilled quota allocations within a specified deadline. Any unused quotas after the deadline will be reallocated to national strategic reserves, which could trigger a concentrated release of accumulated inventories, exerting short-term pressure on spot prices. At the same time, a shortage of local inspection personnel has led to slow approval processes for cobalt intermediates, delaying large-scale arrivals at ports. The structural tightness in domestic raw material supply has not fundamentally eased, with cobalt intermediate prices remaining high, and available supply scarce. Therefore, the traders maintained a bullish outlook and suspended making quotations, providing bottom support for electrolytic cobalt prices. On the macro front, recurring geopolitical risks and increased volatility in commodities have exacerbated market caution. Some traders have advanced their sales to free up capital. The electrolytic cobalt market is currently in a stalemate between cost support and policy pressure, with a weak and volatile trend expected in the short term, pending the implementation of the quota deadline and further clarity on downstream restocking demand.
Cobalt Oxides	China's Co3O4 market prices remained stable last week. This was primarily due to weak demand from downstream lithium cobalt oxide (LCO) producers, who operated at reduced utilization rates and showed limited enthusiasm for raw material procurement, exerting some downward pressure on Co3O4 prices. On the raw material front, cobalt chloride and cobalt sulfate prices remained at high levels, providing significant cost support for CO3O4 and limiting its downside price potential. Market participants currently held a wait-and-see attitude, with a focus on concentrated inquiries expected in late April and pre-holiday stocking ahead of the Labor Day holiday. In the near term, producers are primarily fulfilling long-term agreements and producing on a demand-driven basis. Co3O4 prices are expected to remain stable this week, with the mainstream quotation range holding at Yuan 360,000-370,000/tonne.

Product	Weekly Comment
Lithium Raw Material	Last week, spot prices for domestic spodumene and lepidolite, as well as Australian spodumene CIF prices all edged lower. According to Mysteel’s assessment, spodumene concentrate (CIF China) was quoted at US \$2,130-2,210/tonne. During the week, lithium refineries showed strong interest in sourcing lithium ore, and major producers generally completed their second-quarter stockpiling. The marketable spot inventories held by traders continued to decline. In the near term, it is expected that the lithium ore processing fees will find insufficient support for a hike, but the room for further decline is also relatively limited. According to Mysteel, as of April 9, the lithium ore spot inventory at port and in domestic warehouse among 32 sampled lithium ore traders stood at 143,000 tonnes, down 12,000 tonnes from the previous week. Among this, the marketable inventory was 85,000 tonnes, down 9,000 tonnes week-on-week. Lithium ore prices fell slightly last week, with lithium refineries actively making inquiries. However, the constrained lithium ore processing fees reduced lithium producers’ willingness to sign new contracts, leading to a slower decline in lithium ore inventories.

Product	Weekly Comment
Lithium Carbonate & Hydroxide	As of Friday April 10, China's domestic battery-grade lithium carbonate prices fell Yuan 3,250/tonne, down 2.06% from the previous Friday, while industrial-grade lithium carbonate prices lost Yuan 3,200/tonne, down 2.1% week-on-week, based on Mysteel's assessment. Lithium hydroxide prices also went down Yuan 1,200/tonne last week, down 0.82% on week. Last week, lithium carbonate prices extended the softness. Spot trading of lithium carbonate was sluggish, as downstream manufacturers held ample inventories and were in no rush to buy, only making purchases when futures prices fell. Trader inventories, however, did not continue to decline, and the spot basis for lithium carbonate remained weak. It is expected that there will be a continued inventory drawdown in April based on the supply-demand balance estimation, and the prices of lithium carbonate will remain range-bound in the short term. According to Mysteel, the marketable lithium carbonate inventories held by 43 sampled traders stood at 35,740 tonnes last week, down 3,450 tonnes from the previous week. As prices continued to decline, downstream buying remained modest though contracting from the previous sessions. The physical lithium carbonate inventories (based on 97 sampled players) stood at 72,600 tonnes last week, up 500 tonnes from the previous week. This includes 27,500 tonnes held by upstream smelters, 18,100 tonnes by traders, and 27,000 tonnes by downstream cathode and battery cell factories. During the period from April 3 to April 9, the total lithium carbonate transaction volume in China reached 5,844 tonnes, down 24.6% from 7,755 tonnes in the previous period (March 27-April 2). Among this, transaction volume between traders was 490 tonnes, down 49.5% week-on-week, while downstream transaction volume was 5,354 tonnes, down 21.1% week-on-week.

Product	Weekly Comment
Ternary Cathode Material	The ternary cathode material market exhibited a pattern of stable prices but weakening demand last week. On the cost side, upstream lithium carbonate prices edged downward, slightly weakening cost support for ternary cathode materials. Demand side performance remained sluggish, with production schedules of downstream ternary cathode material plants in April expected to decrease by approximately 2.87% month-on-month. Market transactions were primarily driven by just-in-time procurement. Overall, the ternary cathode material market is expected to remain under pressure from weakening cost support and downstream players forcing down prices.
LFP (Lithium Iron Phosphate)	The prices of power-grade and energy storage-grade LFP declined Yuan 550/tonne and Yuan 300/tonne respectively last week. The weekly contraction was primarily attributed to volatile movements in lithium carbonate prices. Despite the decline, fabrication charges rose due to increasing raw material costs, encouraging LFP manufacturers to raise their quotations.
LCO (Lithium Cobalt Oxide)	The market prices of LCO remained flat last week, with the mainstream quotations at Yuan 405,000-410,000/tonne. Downstream battery cell companies currently showed weak purchasing intentions, focusing primarily on inventory digestion. Some LCO cathode manufacturers have suspended making quotations, waiting for inquiries and procurement demand from the battery cell plants. However, any upward movement in LCO prices has significantly dampened the purchasing willingness of battery cell plants due to the cell plants' high operating costs and compressed profit margin, coupled with weaker-than-expected terminal shipments in Q2 and downward pressure on battery cell prices. It is expected that by late April, the cost support will firm up and break the current market standoff as inventories are gradually digested and cobalt intermediates continue to arrive at ports.

Product	Weekly Comment
Waste Ternary Battery (un-dismantled)	The prices of waste ternary batteries were little changed, with transactions staying flat. The sellers were not in a hurry to sell in the face of soft lithium carbonate, though copper prices slightly rebounded. And the black mass producers' operating rates were low for the lack of raw materials.
Waste LFP Battery (un-dismantled)	The waste LFP batteries prices hovered rangebound with lithium carbonate prices on the downtrend, and the transaction volume contracted compared with the previous week as the sellers and buyers could hardly reach an agreement on the prices.
Ternary Black Mass	The ternary black mass sector saw lackluster transactions as well, and the hydrometallurgical plants were wait-and-see as they held relatively sufficient in-plant stocks. Intensive stockpiling is not expected until the end of April. Nevertheless, the bids and offers on the market have shown a gradual return to rationality。
LFP Black Mass	The volatile lithium carbonate prices cooled the transactions of LFP black mass, putting the hydrometallurgical plants on the sidelines. Some plants indicated that the economic returns from processing cathode powder have weakened, making them more inclined to purchase battery powder or directly acquire used batteries for processing.

Apr 9	- Sunwoda - Entering Tesla supply chain	According to the latest news on April 9, Sunwoda Mobility Energy Technology, a subsidiary of Sunwoda focusing on power batteries, has officially entered Tesla's supply chain, becoming Tesla's fifth global power battery supplier. An industry source familiar with the project revealed that LFP (lithium iron phosphate) batteries for Tesla models have already been shipped from Sunwoda's Yiwu factory in Zhejiang Province. These batteries are being used in export vehicles produced at Tesla's Shanghai Gigafactory, and shipments have been ongoing for some time.
Apr 9	Integrated LFP project	On April 9, MGL announced that it plans to sign an investment agreement with the Administrative Committee of Dazhou High-tech Industrial Park and establish a wholly-owned subsidiary, Sichuan MGL New Material Technology Co., Ltd., with an investment of Yuan 500 million, to implement the fourth-generation and beyond lithium iron phosphate (LFP) integrated project. The project consists of two sub-projects, including lithium iron phosphate and iron phosphate, both to be constructed in two phases. The LFP sub-project requires a total investment of approximately Yuan 1.8 billion, while the iron phosphate sub-project requires approximately Yuan 1.2 billion, bringing the combined total investment to about Yuan 3.0 billion. The first phase of the project is expected to complete equipment commissioning by March 31, 2027. The second phase will be initiated at an appropriate time after the first phase is completed and operational.
Apr 9	- Sinomine - Q1 2026 earnings report	On April 9, Sinomine Resource Group announced that it expects the net profit attributable to shareholders of the listed company for the first quarter of 2026 to be between Yuan 500 million and 550 million, representing a year-on-year increase of 270.97% to 308.07%. Driven by growing downstream demand for energy storage and power batteries, the market prices of lithium salt products increased significantly compared to the same period last year. As a result, the profit from the company's lithium battery new energy raw material development and utilization business increased year-on-year, enhancing the company's overall profitability. The company's Tsumeb smelter in Namibia also reduced its loss compared to the same period last year. (Note: Sinomine Resource Group reported a net profit of Yuan 253.4 million in Q4 2025. Based on this, the estimated net profit for Q1 2026 represents a sequential increase of 97.32% to 117.05%.)

Apr 8	- CNGR - Q1 2026 earnings report	On April 8, CNGR announced that it expects the net profit attributable to shareholders of the listed company for the first quarter of 2026 to be between Yuan 530 million and 590 million, representing a year-on-year increase of 72.32% to 91.82%. During the reporting period, benefiting from the rapid development of the global new energy market and the company's leading position in the battery materials sector, total sales volume of its battery material products, including nickel-based, cobalt-based, phosphorus-based, and sodium-based series, reached nearly 130,000 tonnes. The battery materials business exhibited a robust trend of growth in both production and sales, strongly supporting the steady increase in the company's operating profit.
Apr 8	10,000 t/y lithium carbonate project	Recently, the Hengyang Municipal Bureau of Ecology and Environment of Hunan Province released the Public Notice on the Acceptance of the Environmental Impact Assessment Report for the 10,000 Tonnes Battery-Grade Lithium Carbonate Production Project of Hunan Bicheng Technology Co., Ltd. The project is planned to be constructed by Hunan Bicheng Technology Co., Ltd. within its existing plant site. The company is currently a large-scale enterprise specializing in the production of high-end calcium oxide and calcium hydroxide. It operates two rotary kiln high-activity lime production lines and one calcium hydroxide production line, with an annual production capacity of 380,000 tonnes of high-activity lime and 110,000 tonnes of calcium hydroxide. To further expand its market presence, the company plans to decommission its high-activity lime production lines and cease the production of 380,000 tonnes of high-activity lime. It intends to utilize the existing site of the high-activity lime production lines and the rotary kilns to construct a 10,000 tonnes per year battery-grade lithium carbonate production project.

Apr 8	- Canmax - Q1 2026 earnings report	On April 8, Canmax announced that it expects the net profit attributable to shareholders of the listed company for the first quarter of 2026 to be between Yuan 900 million and 1.05 billion, representing a year-on-year increase of 27,517.53% to 32,120.45%. During the reporting period, driven by growing downstream demand for energy storage and power batteries, the company's lithium battery materials business saw a significant increase in profit. The company estimates that the impact of non-recurring gains and losses on the net profit attributable to shareholders of the listed company for Q1 2026 will be approximately Yuan 22 million.
Apr 8	2,000-tonne silicon-carbon anode project	On April 8, Binhai Energy stated on an interactive platform that the company is constructing a 2,000-tonne silicon-carbon anode production capacity suitable for solid-state batteries in Baotou City, as well as a 1,000-tonne porous carbon production capacity in Xingtai City. Currently, the aforementioned projects are all in the construction phase and have not yet commenced mass production or delivery. The research and development of various silicon-based anode products are currently at different stages of validation.
Apr 7	- EVE Energy 110 GWh energy storage battery project	On April 7, EVE Energy announced two new energy storage projects, with a combined planned investment of RMB 11 billion to add 110 GWh of new capacity. Adding the Huizhou Zhongkai and Jingmen projects disclosed days earlier, the company's total planned capacity for energy storage (and power) batteries announced this year has now reached 230 GWh. In an evening announcement on April 7, EVE Energy disclosed plans to sign an agreement with Jiangsu' Qidong municipal government to build a 50 GWh energy storage (and power) battery production base in Qidong Economic Development Zone, with a total investment of approximately RMB 5 billion. A separate announcement indicated that the company also plans to sign an agreement with the Fujian's Shanghang County government to build a 60 GWh energy storage battery production base, with a total planned investment of approximately RMB 6 billion. The project will be developed as a joint venture between EVE Energy and Longking Environmental Protection, with EVE Energy holding an 80% stake.

Apr 7	- EVE Energy - Q1 2026 earnings report	On April 7, EVE Energy announced that its net profit attributable to shareholders of the listed company for the first quarter of 2026 is expected to reach Yuan 1.376 billion to Yuan 1.487 billion, representing a year-on-year increase of 25.00% to 35.00%. The main reasons for the performance change are as follows. In detail, the company has adhered to product iteration and service upgrades, seizing market opportunities to drive business growth. At the same time, through proactive management measures such as supply chain diversification and strategic procurement, it has effectively cushioned the fluctuation impact of rising material costs, ensuring the stable profitability of its core business.
Apr 7	- Huayou Cobalt 2025 earnings report	On the evening of April 7, Huayou Cobalt released its 2025 annual report. In 2025, the company's cobalt product production volume reached 51,196.91 tonnes in metal content, representing a year-on-year increase of 4.54%. And sales volume amounted to 46,547.56 tonnes in metal content, a decrease of 0.62% YoY. Moreover, inventory stood at 14,813.30 tonnes in metal content, a surge of 150.81% YoY.
Apr 6	- Indonesia - RKAB nickel mining quota progress	As of April 6, 2026, Indonesia's Ministry of Energy and Mineral Resources has approved 2026 Work Plan and Budget (RKAB) nickel production quotas totaling approximately 190-200 million tonnes. Minerals and Coal Director General Tri Winarno stated on the same day that while some RKAB-related data is still being finalized, the overall approval process is nearing completion. Responding to the Energy and Mineral Resources Minister's earlier remarks about potential quota relaxations, Tri noted that specific easing mechanisms have yet to be determined. Any relaxation would need to be implemented through RKAB revisions, which have not yet been submitted. He emphasized that quota adjustments will continue to follow the principle of supply-demand balance, as any oversupply in the market would once again pressure nickel prices. Therefore, the 2026 nickel production quota is expected to remain within the range of 190-200 million tonnes per year, with the final figure depending on whether and how relaxation mechanisms are introduced.
